HARDEX®

XPP OPTIMA

SPUR HARDEX XPP OPTIMA is a thermoplastic structured foam made of polypropylene (PP). The structure of the foam is made up of 95-98% by closed cells. It offers excellent mechanical properties in shear and compression, impact strength. It is resistant to fatigue stress. The material has an excellent chemical resistance, water resistance, organic solvents resistance and health safety. The foam can be produced with higher resistance to UV radiation, recycled content or with higher resistance to burning and emits significantly lower toxic fumes when burning ompared to other materials. The advantage is its recyclable.

Compared to materials made from foamed PET or PS, **SPUR HARDEX XPP OPTIMA** offers better mechanical properties.

SPUR HARDEX XPP OPTIMA can be used as a core for a composite sandwich structure with excellent mechanical properties combined with low weight. It is used in areas where the lightness and mechanical resistance of the product is required, e.g.: furniture boards, structural boards/profiles, the construction industry, the automotive industry – interior equipment (caravans, trucks, ...). The foam can be processed and cut similarly to wooden materials and can be joined with screws, nails, and glues, by fusion welding and hot air welding. It has the ability to process by thermoforming. Also, the material can be laminated with functional surface layers by reactive or hot-melt glues, or in case of good compatibility without glues by heat only.

MECHANICAL PROPERTIES

Tensile properties (all values in tolerance ± 7,5%)										
Type of te	st	Norm	Units							
Bulk Density		EN 1602	kg.m -3	40	60	80	100	120	150	200

THERMAL PROPERTIES

Type of test	Norm	Units								
Bulk Density	EN 1602	kg.m⁻³	40	60	80	100	120	150	200	
Thermal conductivity	EN 12667	W.m1K-1	0,043	0,043	0,042	0,041	0,040	0,040	0,040	
Coefficient of linear thermal expansion	ISO 11359-2	(10 ⁻⁵) K ⁻¹	16	14	9,9	5,2	4,1	3,5	1,9	
Max. process temperature without thickness loss	-	°C	155							
Short-time operating temperature	-	°C	from -40 to +130							
Continuous operating temperature	-	°C	from -30 to +100							
Laminating temperature *	-	°C	from +140** to +200 (recommended)							
Thermoforming temperature *	-	°C	from +130 to +170 (for foam) up to +200*** (for sandwich type)							

* During the use of high temperatures above 160 °C, the thickness loss depends on setting, time, and properties of the laminated layer.

** With using special lamination layer (upon inquiry).

*** Upon inquiry.

FIRE PROPERTIES

Type of test	Norm								
Bulk Density	EN 1602	40	60	80	100	120	150	200	
	EN 13501-1	Class E, D, C							
Fire classification of buildings and constructions	DIN 4102-1	Class B3, B2, B1							
	UL94	Class HBF, HF1, HF2, V0, V1, V2							

OTHER PROPERTIES

Type of test	Norm	Units							
Bulk Density	EN 1602	kg.m⁻³	40	60	80	100	120	150	200
